GeekyAnts is a design and development studio specializing in building efficient digital solutions for web and mobile. We leverage technology to drive innovations and have helped many industries revolutionize their processes. Being early adopters of many niche tech stacks, we have expertise in using cutting-edge technologies like React, React Native, Flutter, Angular Vue, NodeJS, Python, and Svelte to name some.

GeekyAnts has worked with 500+ clients around the globe, delivering tailored solutions to a wide array of industries. We have also been the trusted tech partners of some of the world's top corporate giants and have also helped small and mid-sized companies realize their vision and transform digitally through research and collaboration.

We are passionate about technology because of which our mission is to empower everyone to build things with our exclusive range of products while also offering services ranging from **web and mobile development, UI/UX design, DevOps, QA, and API development to business analysis, product management**, delivery, and support, amongst other things. We're also a global company with offices in the UK and the United States.

[GeekyAnts products](#)

- **Marketplace React Native** : Your one-stop shop for trusted React Native apps and components.
- **NativeBase Startup+** : A bundle of 80+ screens which can help you ship your apps faster on both native and web platforms.
- **NativeBase** : An open-source UI library offering accessible React Native components for mobile and web platforms.
- **TopGeek** : An automated platform streamlining all your hiring processes from start to end.
- **BuilderX** : A design tool that writes React Native code for you, BuilderX also offers a Mac app for desktop to replace your traditional UX tools.

GeekyAnts team

We, at GeekyAnts, do more than merely develop software products! Our geeks love to play around with the latest technologies and have overcome challenges by experimenting and creating innovative products. Come join us and build things. Cheers!

Eligibility:

- 2027 batch BE/ BTech (CS/ IT/ ECE related branches)
- Good academic track record
- Good pH score

Job Description:

The Role :

As an SE Engineer I at GeekyAnts, you will design and ship software for real client products — not research prototypes. You will work alongside experienced engineers on production systems across web, mobile, backend, and platform engineering.

We are looking for strong computer-science fundamentals, sharp problem-solving, and clean programming skills. You should be comfortable working alongside AI coding agents as part of a modern engineering workflow. Deep AI/ML expertise is a plus, not a requirement. You will also contribute to internal R&D and gradually take ownership of features end-to-end.

What You Will Do

- Write clean, well-tested, production-quality code for client and internal products.
- Break down complex problems into small, well-defined components — applying core CS concepts (data structures, algorithms, complexity, concurrency) to make sound engineering decisions.
- Read and reason about existing codebases — debug issues, trace failures across services, and propose improvements.
- Work alongside AI-augmented coding workflows — use LLM-powered tools and coding agents responsibly, evaluate their output critically, and integrate them into day-to-day development.
- Build and integrate REST/GraphQL APIs with standard production concerns — auth, logging, error handling, and observability.
- Collaborate with senior engineers on feature design, API contracts, and service boundaries.
- Participate in design discussions, code reviews, and sprint planning.
- Continuously learn — pick up new languages, frameworks, and tools (including AI/ML stacks where projects call for it) as needs evolve.
- Contribute to GeekyAnts' internal R&D — experiment with new tooling, write up findings, and share learnings with the team.

Skills required:

- Core Computer Science fundamentals — data structures, algorithms, OS, networking, databases, time and space complexity.
- Strong problem-solving — ability to break down ambiguous problems, design clean solutions, and reason about trade-offs.
- Strong programming acumen — clean, idiomatic code in at least one language (Python preferred; Java, C++, Go, or TypeScript also welcome).
- Understanding of agentic behavior in coding practices — comfort working with AI coding assistants and LLM-powered agents; ability to direct, evaluate, and validate their output rather than copy-paste.
- Comfortable with debugging, testing, and reading unfamiliar codebases.
- Git, command-line, and basic Linux familiarity.
- Solid written and verbal communication — can explain reasoning and trade-offs clearly.
- Eagerness to learn — curious about new tech, willing to dive into unfamiliar codebases and domains.

Good to have Experience:

- Exposure to AI/ML concepts — supervised/unsupervised learning, transformers, embeddings.
- Hands-on with LLM APIs — OpenAI, Anthropic, Gemini.
- RAG architecture basics — chunking, embeddings, retrieval.
- Vector DBs — Pinecone, Weaviate, Qdrant, or pgvector.
- FastAPI or other production API frameworks.
- LangChain or similar agent/LLM orchestration libraries.
- Prompt engineering and structured output handling.
- HuggingFace ecosystem — transformers, PEFT, fine-tuning (LoRA/QLoRA).
- Agent design — tool-calling, MCP, multi-step reasoning.
- Basic DevOps — Docker, CI/CD.
- TypeScript / Node.js for full-stack integration.
- Personal projects, open-source contributions, or hackathon experience.

What We Look For

Beyond skills, this is the profile that thrives at GeekyAnts:

- You have built something — a class project, internship deliverable, side project, hackathon entry, or open-source contribution — and can walk us through the decisions you made and

What you'd do differently.

- You think like an engineer — you reason about trade-offs in latency, memory, complexity, and failure modes before you write code.
- You can explain a technical decision to a non-technical stakeholder — clearly, without jargon.
- You can work with AI coding agents as a collaborator — guiding them, reviewing their output, and knowing when to override or push back.
- You are curious about what's happening across software and AI. You read, tinker, and stay current — even on tech you haven't used yet.

- You write clean, readable code. You care about quality even in fast-moving projects.

Service Agreement:

- The Agreement tenure will be for 30 months from the date of joining.
- The company spends considerable effort in training new employees through direct mentoring by senior folks.
- Only candidates willing to commit to 30 months of tenure need to apply.

CTC details:

Particulars	Internship Period	Employment Period	
	From Joining till Degree Completion	1st Year	2nd Year
Lock-in / Bond Period	30 months From Date of Joining		
Monthly Stipend	25,000		As Per Industry Standard
Yearly Fixed Salary		6,00,000	
Annual Variable Bonus		1,00,000	
Monthly Salary		50,000	
Yearly CTC	3,00,000	7,00,000
